

TARAL AI LLP

While working with multiple schools and various organizations for the AI based student engagement level detection project, I realized that there is lot of future development work to be done. Although I created a mobile app which teachers can use to determine the engagement levels of the classroom and each individual student, there is a lot of initial training and support that is needed to make the algorithm work in schools.

Also, during my discussions with Pune Knowledge Cluster (PKC), a good suggestion from the team was to implement Gen AI for this project. This is when I decided that I need to establish a company as the research project had now grown into a full-scale implementation.

I also started talking to some senior people for Angel funding. This is when I got in touch with Shantanu Nipunage, an ex-HP Silicon Valley veteran who had just founded Taral AI LLC in US. He was visiting India and was looking for investments in AI based technologies in various domains. After multiple discussions, he decided to invest \$125,000 in my product so that we can develop and support this technology.

We have now registered a company in India Taral AI LLC with me being the Founding Engineer working on various products in the Education vertical. Along with AI based Student Engagement Level Detection product, we are also exploring ways to take the Swachh Shala (Clean Schools) product to the next level.
